

Preparing for the Storm: Minimizing Risk through Resilience

October 4th, 2018

Speakers

Lauren Taymor

*Sustainability
Consultant, DNV GL*

Betty Seto

*Head of Department,
Sustainable Buildings
and Communities,
DNV GL*

Cory Gessert

*Team Lead,
Owner's
Engineering, DNV
GL*

Webinar agenda

01 Introduction to DNV GL

02 What is a resilient building?

03 Resilient building energy systems:
Seattle City Light microgrid

04 Protecting vulnerable populations:
Low-income multi-family

05 Q&A

About DNV GL

In a challenging world we make buildings and communities better prepared for the future

**Vulnerability
Mapping**

**Energy Audits of
Building Systems**

**Zero Net Carbon
Buildings**

**Emergency
Preparedness**

**Climate Hazard
Identification**

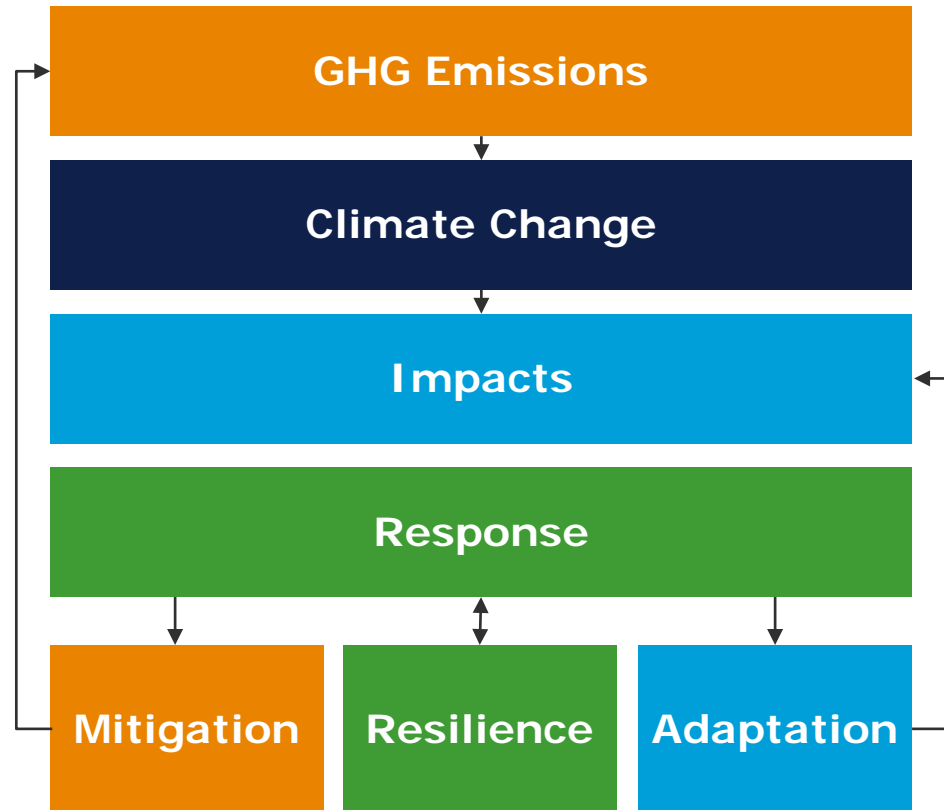

**High Performance
Buildings**

**Resilient
Building Design**

**Distributed Energy
Resources**

Setting the stage: What does it all mean?

- **MITIGATION** is action taken to reduce activities that drive man-made causes of climate change
- **ADAPTATION** involves actions taken to counteract new or changing environmental challenges and reduce the vulnerability of human systems to the effects of climate change
- Building **RESILIENCE** is the capacity of a building to continue to function and operate under extreme conditions, such as (but not limited to) extreme temperatures, sea level rise, natural disasters, etc.

\$1 USD
spent on
mitigation
saves an
average of
\$6 USD
in damages

Florida's building codes show investing in resilience pays off

Reduced hurricane-
related losses by 72%

\$6 in avoided losses
per additional \$1 in
construction costs

What does a climate-ready building look like?

Elevated
mechanical
systems

Enhanced
daylighting

Community
center

Urban tree
canopy

Solar PV and
backup power
source

Deployable
flood barrier

Living shoreline
and green
infrastructure

Protected
accessibility
points

Optimized energy use
Low-energy mechanical systems and natural ventilation
Well-insulated envelope
Flood insurance

B-READY

Building Resilience Assessment Tool

Extreme weather events are on the rise

B-READY helps building owners prepare

B-READY helps building owners and managers translate climate-related risks into actionable resilience strategies

Simplify Actions

Resilience best practices into site-specific recommendations relevant to each building

Benchmark

Resilience index allows for benchmarking over time or across a portfolio of buildings

Be Holistic

Incorporates occupant awareness, health and well-being, and community equity measures

From A to Z: B-READY approach to assessing building resilience

B-READY considers the hazards to the building based on the occurrence of climatic events

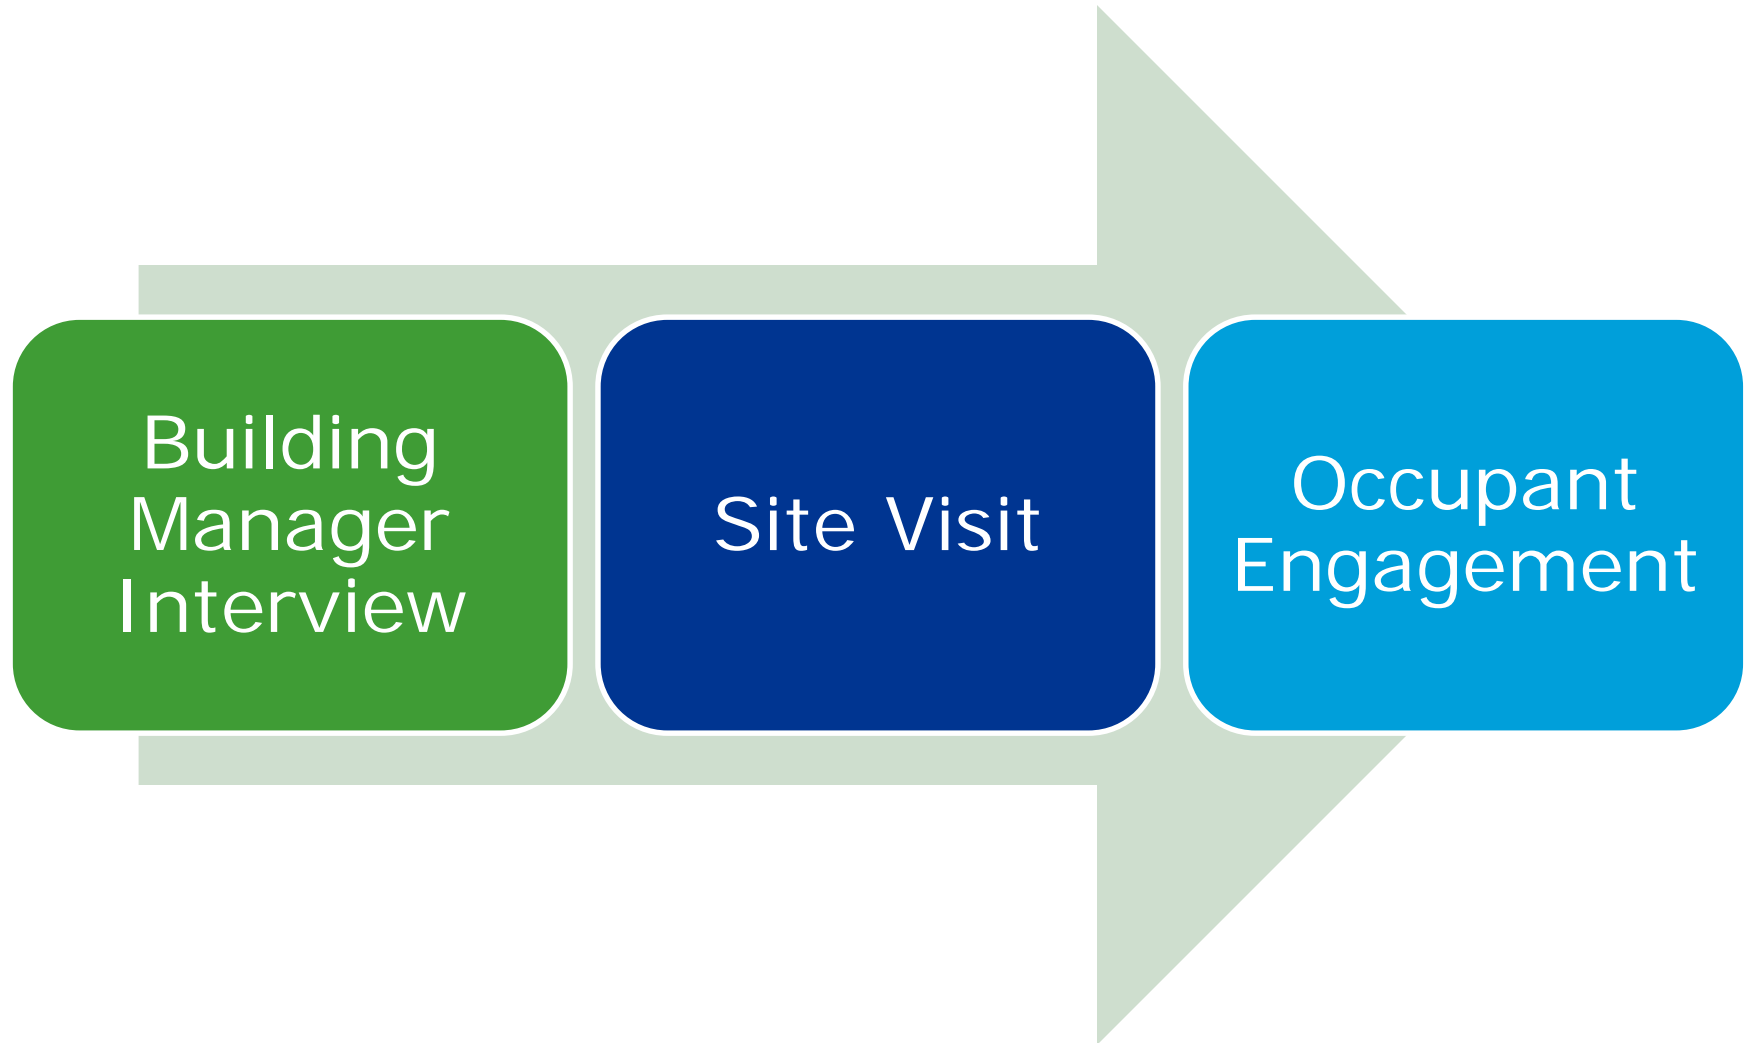

Emergency covers impacts that could occur during any type of event, such as building evacuation.

Climatic Event Hazard Matrix

Climatic Event	Hazard Types												
	Air Pollution	Damaging Winds	Extreme Cold	Extreme Heat	Extreme Rainfall	Fire	Flooding	Hail	Lightning	Power Disruption	Snowfall	Water Pollution	Water Supply Disruption
Ambient Air Quality													
Coastal Surge, Sea Level Rise, and Riverine Flooding													
Drought													
Earthquake													
Extreme Precipitation													
Extreme Winter Conditions													
Heat Waves													
Wildfires													
Windstorms													
Building-Specific Hazards													

Site conditions and building history are taken into account in the hazard assessment. For example, a building not located in a floodplain but positioned such that unmaintained city storm drains could cause flooding.

Assessing resilience at the site: Building walkthrough process

Scenario discussions: People remember experiences best

In a power outage...

What are your biggest problems?

What do the occupants do?

What would the occupants do if it was 90 degrees out?

What would individuals with medical conditions do?

In a heat wave...

What systems would you be worried about?

Would you provide any cooling services to the occupants?

What would elderly/children or do?

If a wildfire was approaching...

How would the occupants be notified?

Would mechanical systems be turned off?

Are there evacuation procedures for the building?

Resilience measures can be organized by hazard or building system, making it easy to understand system vulnerabilities

Envelope and Structure

HVAC and Controls

Electrical and Lighting

Communications and Security

Interiors, Equipment, and Furnishing

Energy Generation and Storage

Fire Suppression

Plumbing

Site

Conveying Equipment

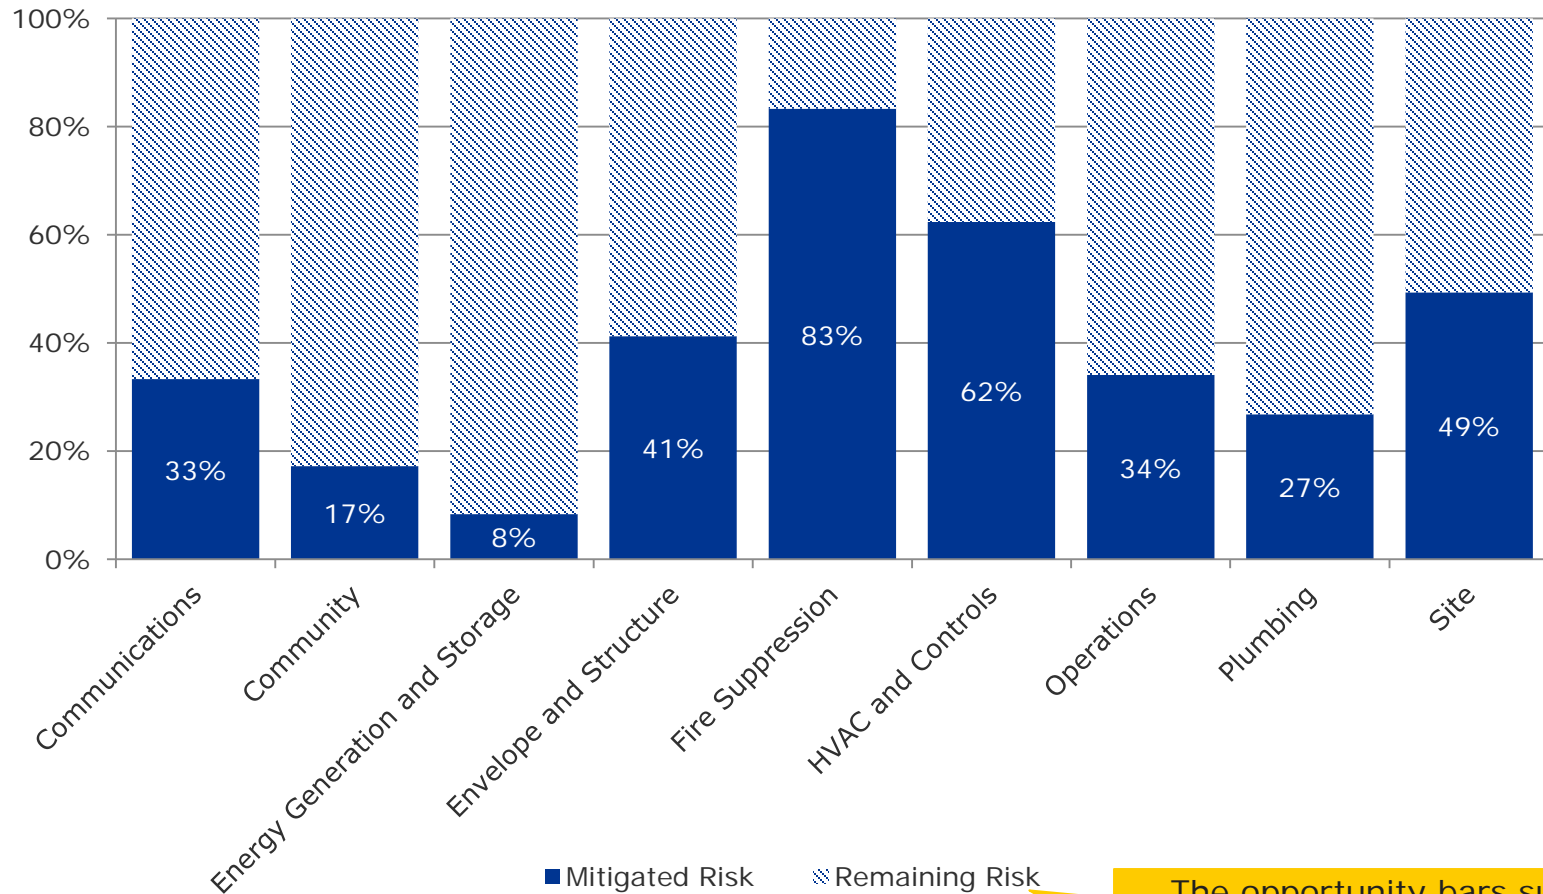

Operations

Community

B-READY shows how resilient each building system is to the local hazards

The opportunity bars suggest areas that the building owner should invest in to improve building resilience.

B-READY provides analysis and recommendations in a concise report, helping owners prioritize

Key opportunities for improved resilience

Recommendations:

Capital investments

External communication systems, reliable backup power, CO₂ sensors, water storage, bioswales

Labor investments

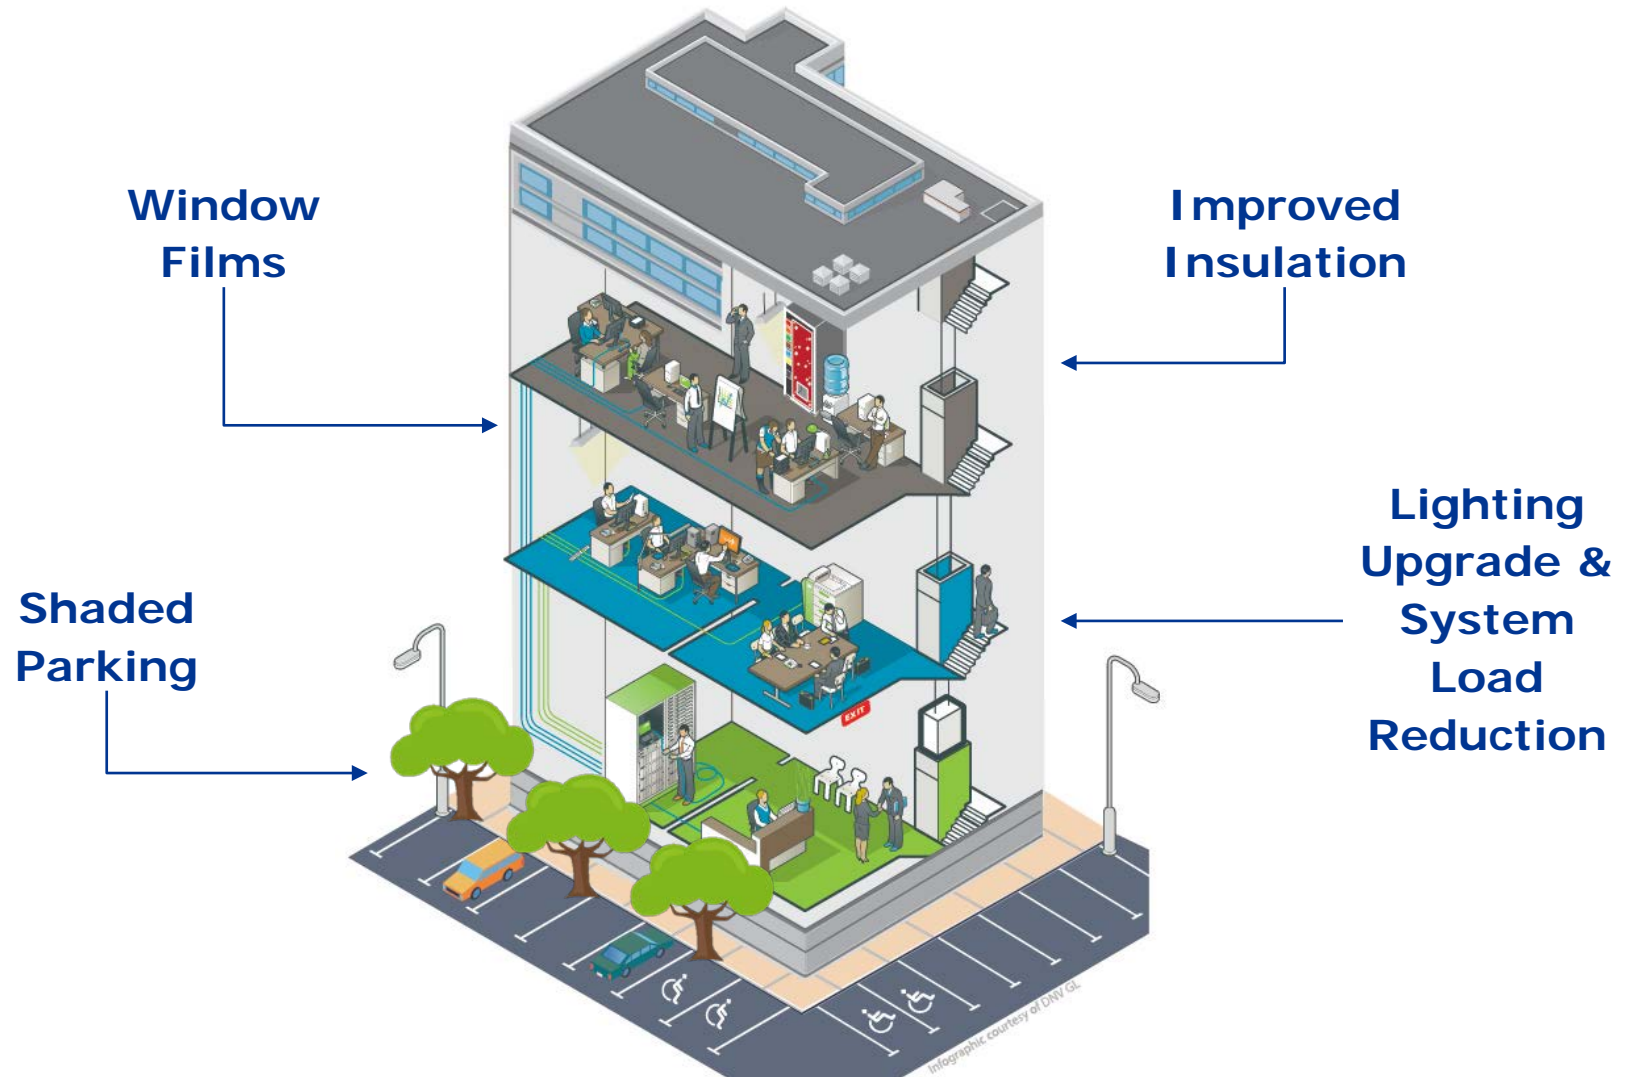

Retro-commissioning, fire mitigation techniques, safeguard toxic materials, operations and materials plans

Social investments

Emergency plans, first aid, security, areas of refuge, risk awareness education, flexible dress codes and scheduling

The energy efficiency connection: Identifying resilience co-benefits

Seattle City Light – Microgrid for Resilience

Site Selection and Owner's Engineering

Clean Energy Fund - \$12.6M to five WA utilities

Seattle City Light microgrid project

- **Primary goal:** to ensure that electric supply is maintained during periods of emergency or grid outage.

NEW MILLER COMMUNITY CENTER

Why Miller Community Center?

- Maximize positive community impact, including serving a low-income community
- Increase resiliency, reliability
- Carbon-free power source during emergencies

City Light project inception

- Many Stakeholders
 - Department of Commerce – funding
 - Seattle Department of Parks & Recreation – host site
 - City Council
 - Office of Emergency Management
 - Office of Sustainability & Environment (Resiliency)
 - Many internal City Light Divisions
- First Technology Innovation Division project

Three year schedule from inception to commissioning

Scope of Work	Timeline
Site evaluation	Oct 2017
Building loads estimation (normal and emergency)	Nov 2017
Site analysis and down-selection	Dec 2017
Preliminary (30%) design, CapEX estimate, high-level schedule	March 2018
Drafting of technical specifications for RFP	June 2018
Bid evaluation and interviews	Oct 2018
Design review (50%, 90%, IFC)	Jan-April 2019
Construction monitoring	June-Dec 2019
Commissioning oversight	Dec 2019
Training, O&M	Jan 2020

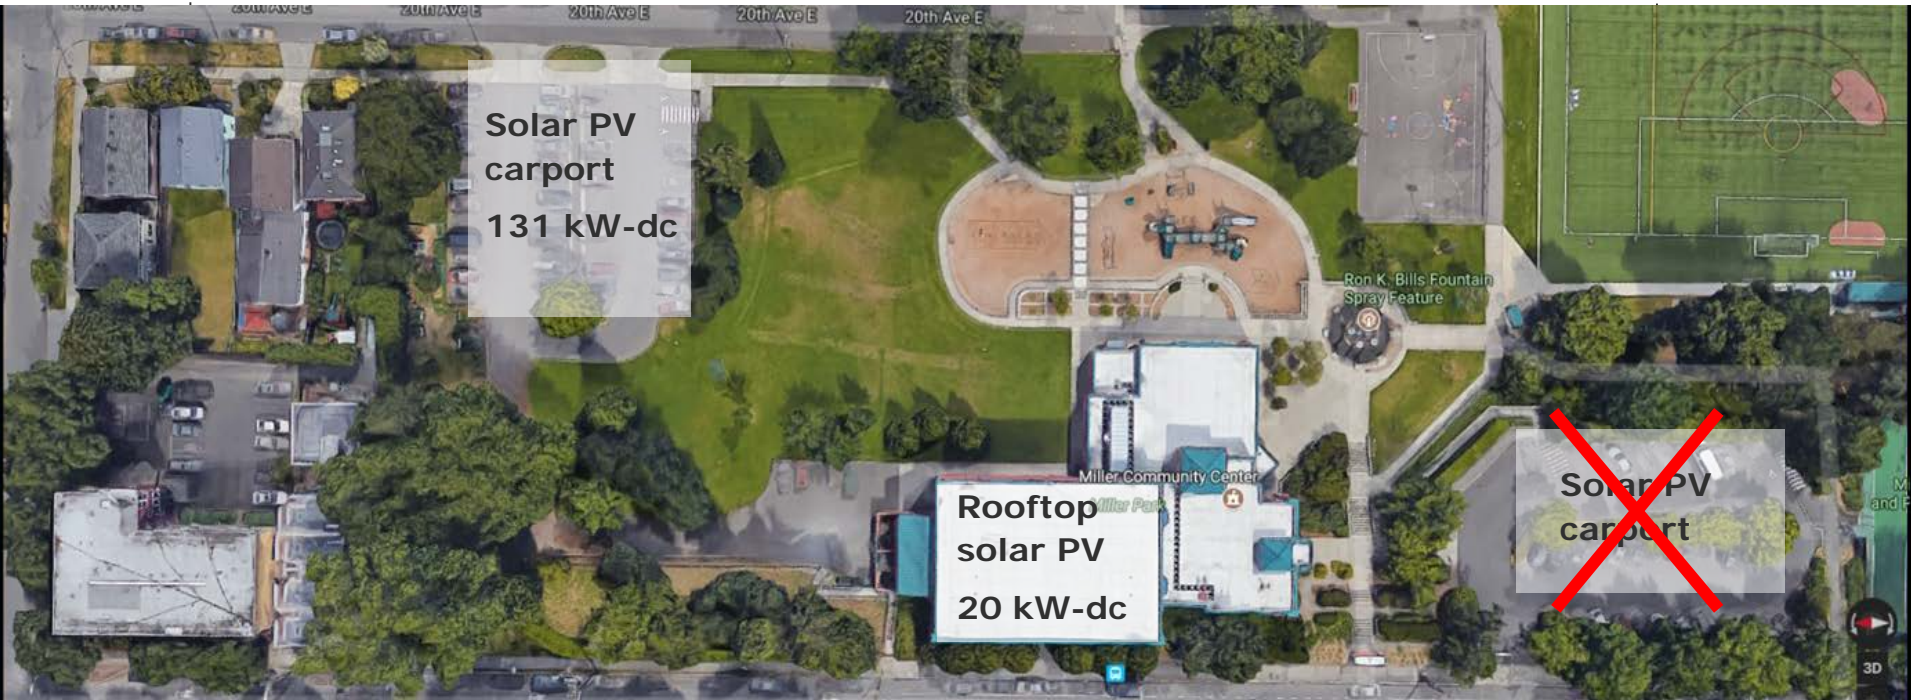

Harnessing the power of storage for resilience

Conceptual design

- Miller Community Center
 - Emergency peak load 70 kW, annual energy consumption ~300 MWh
- The System will island and operate autonomously in the event of an outage to provide back-up electric power for at least 16 hours.
- A battery energy storage system with power capacity in the range of 200–250 kW and energy capacity in the range of 750–1,000 kilowatt hours.
- A rooftop PV array in the range of 40–50 kilowatts.

Programmatic approach to resilience

Lessons learned from NYC and Sonoma County

5 Sonoma County Multifamily Buildings – Pilot with StopWaste

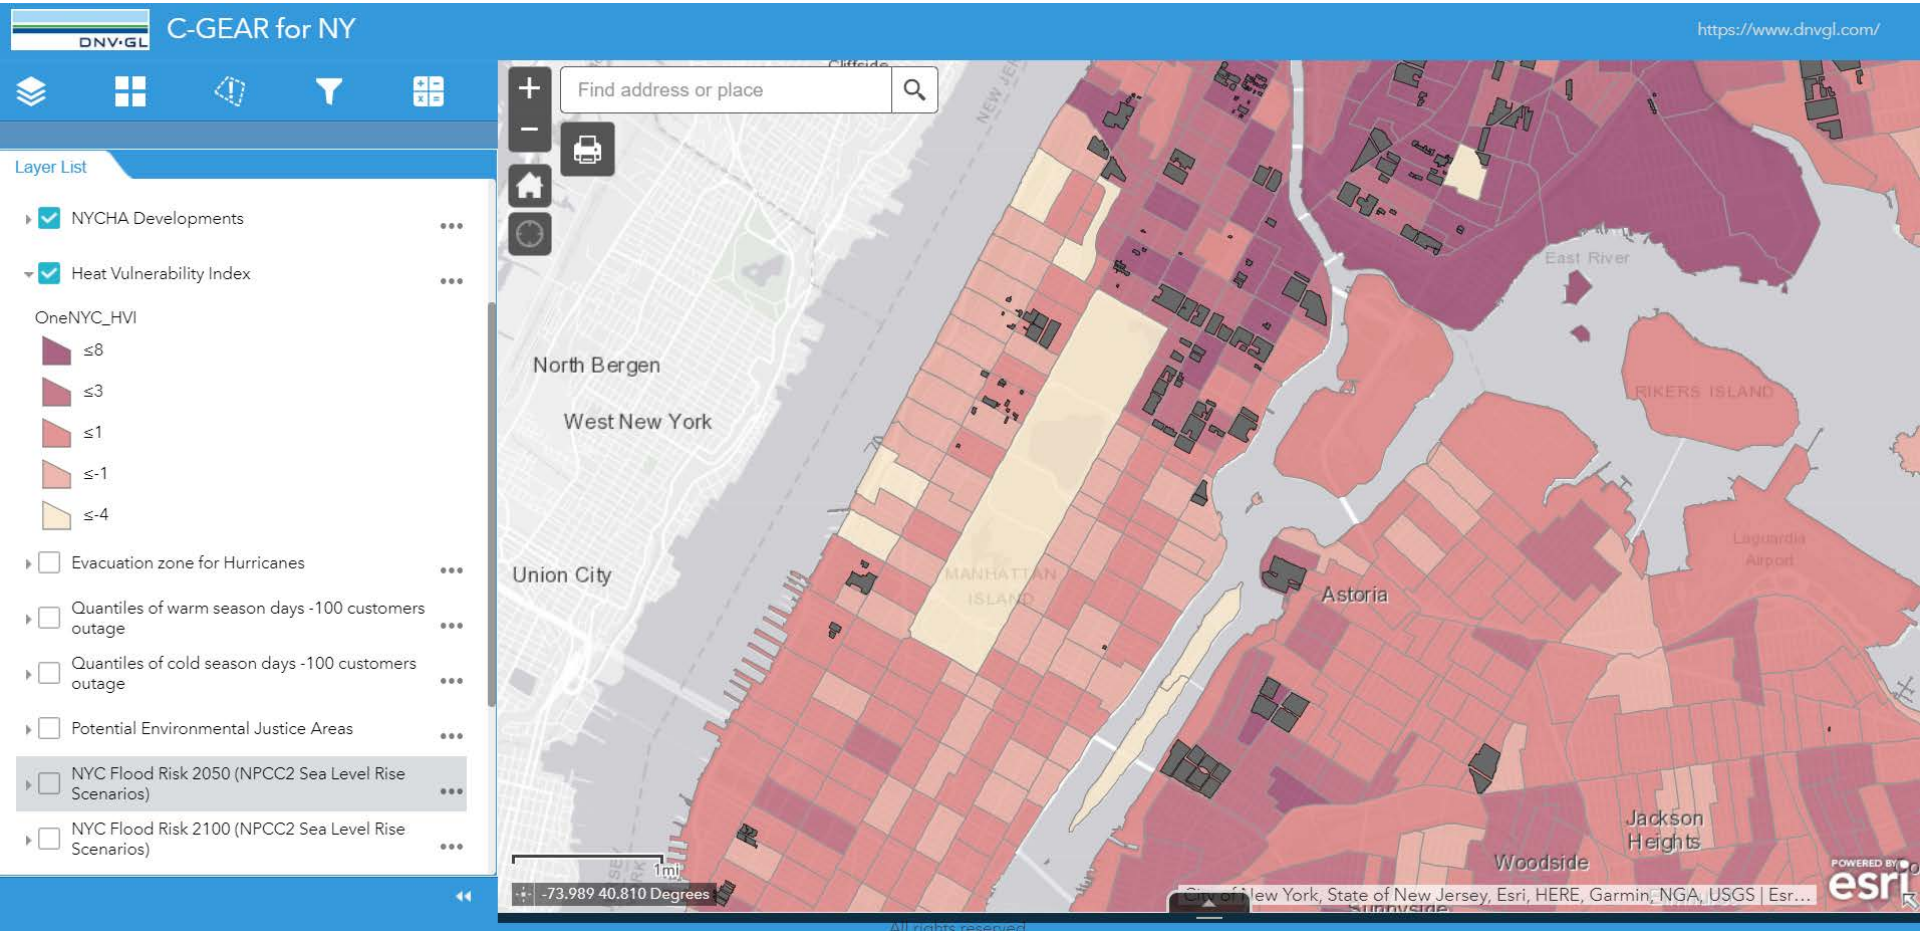

Goal: Tie in Energy Audits + Resilience Assessments using DNV GL's B-READY tool

NYC Housing Authority

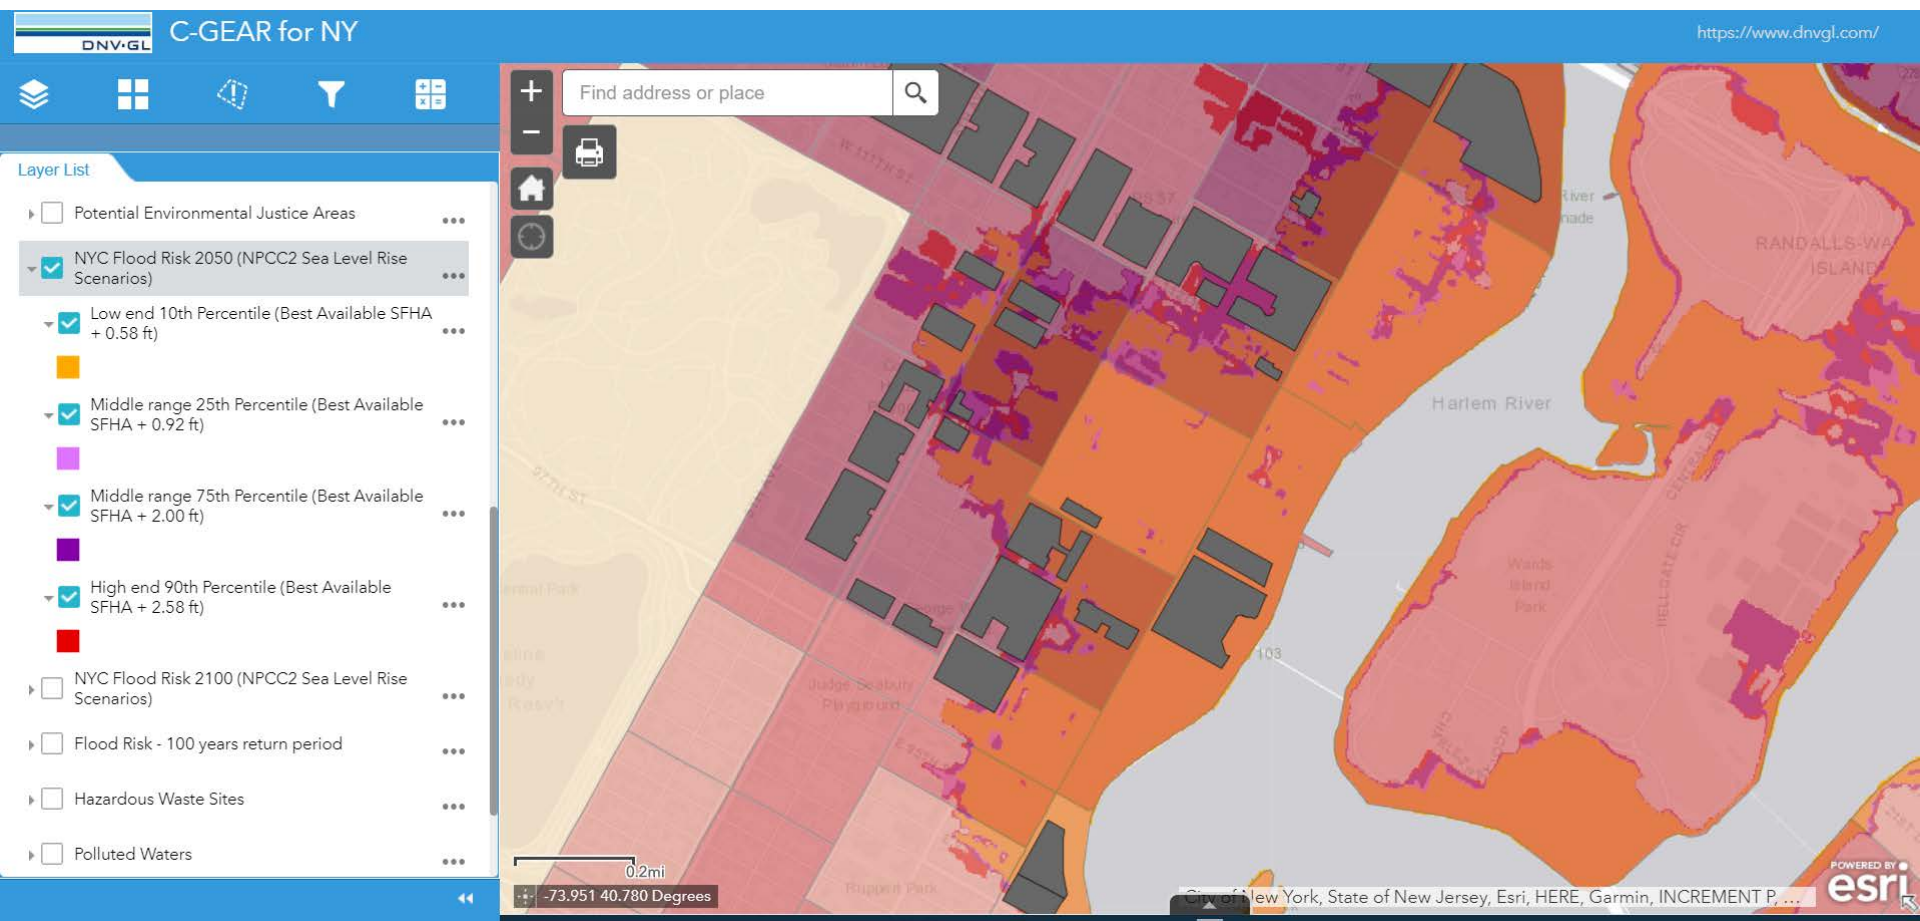

- Pilot resilience assessments of 10 NYCHA buildings with funding support from NYSERDA
- **Goal:** Address resilience in low-income multifamily housing

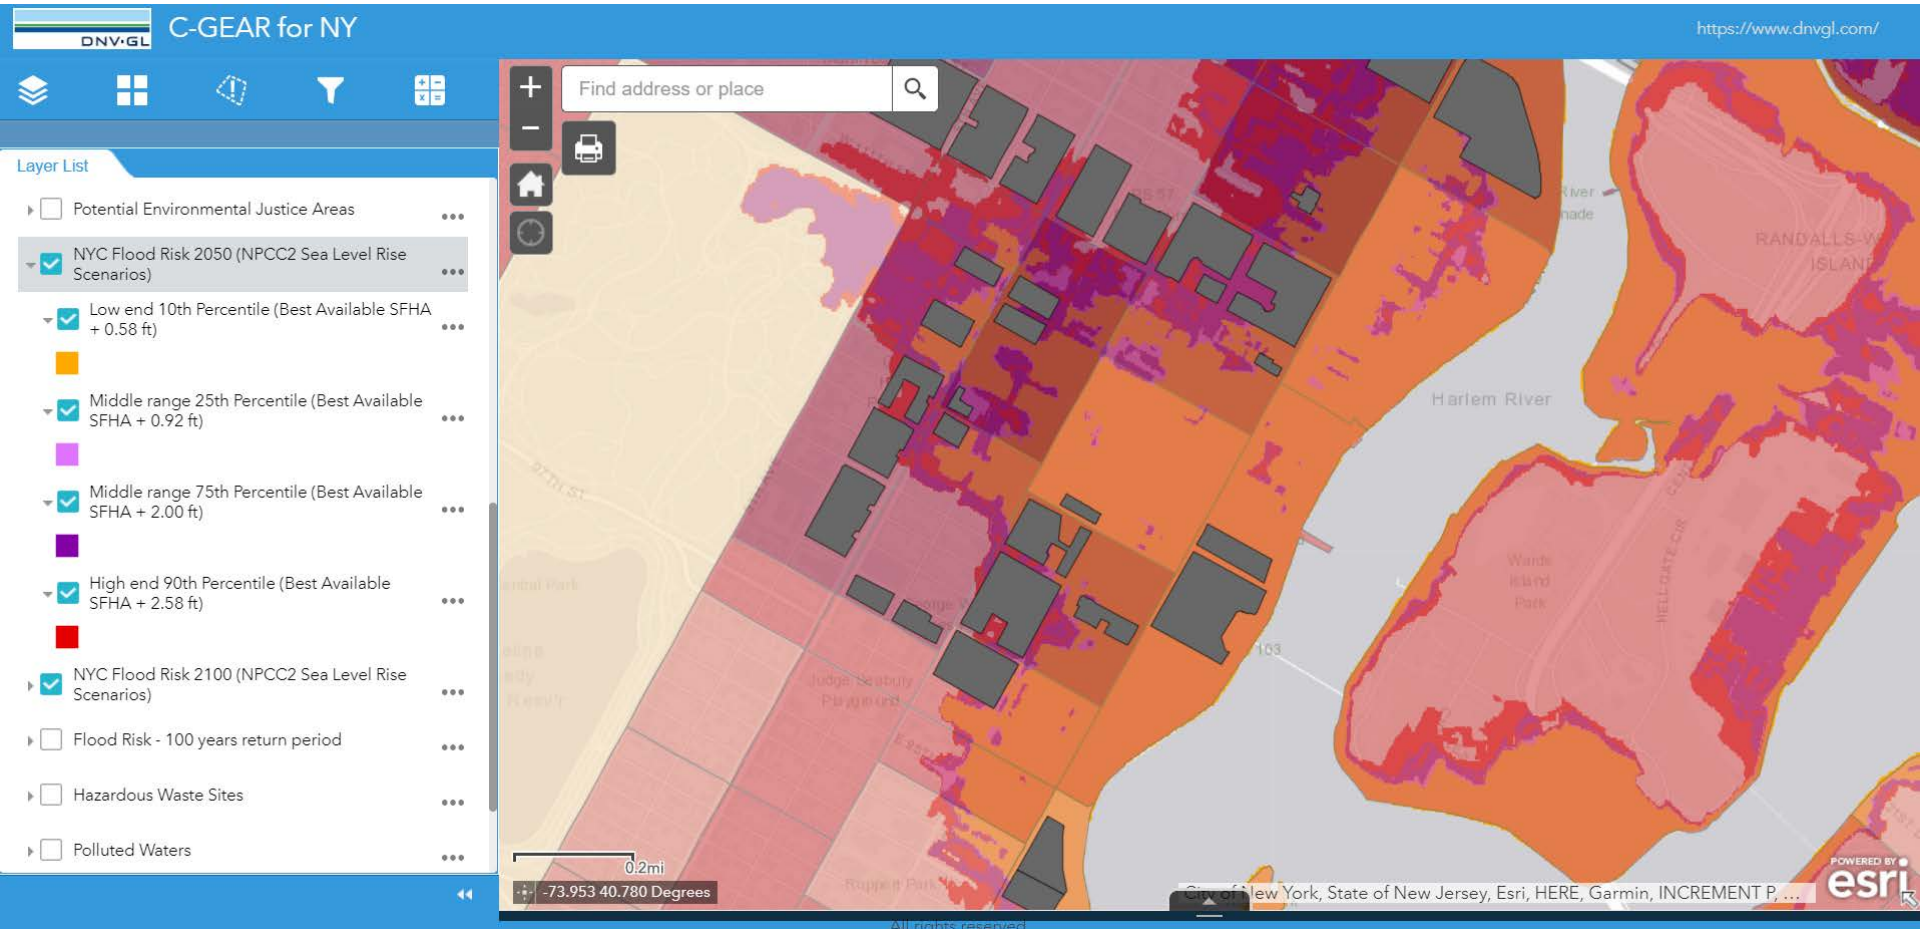

Identifying portfolio-level vulnerabilities

Identifying portfolio-level vulnerabilities

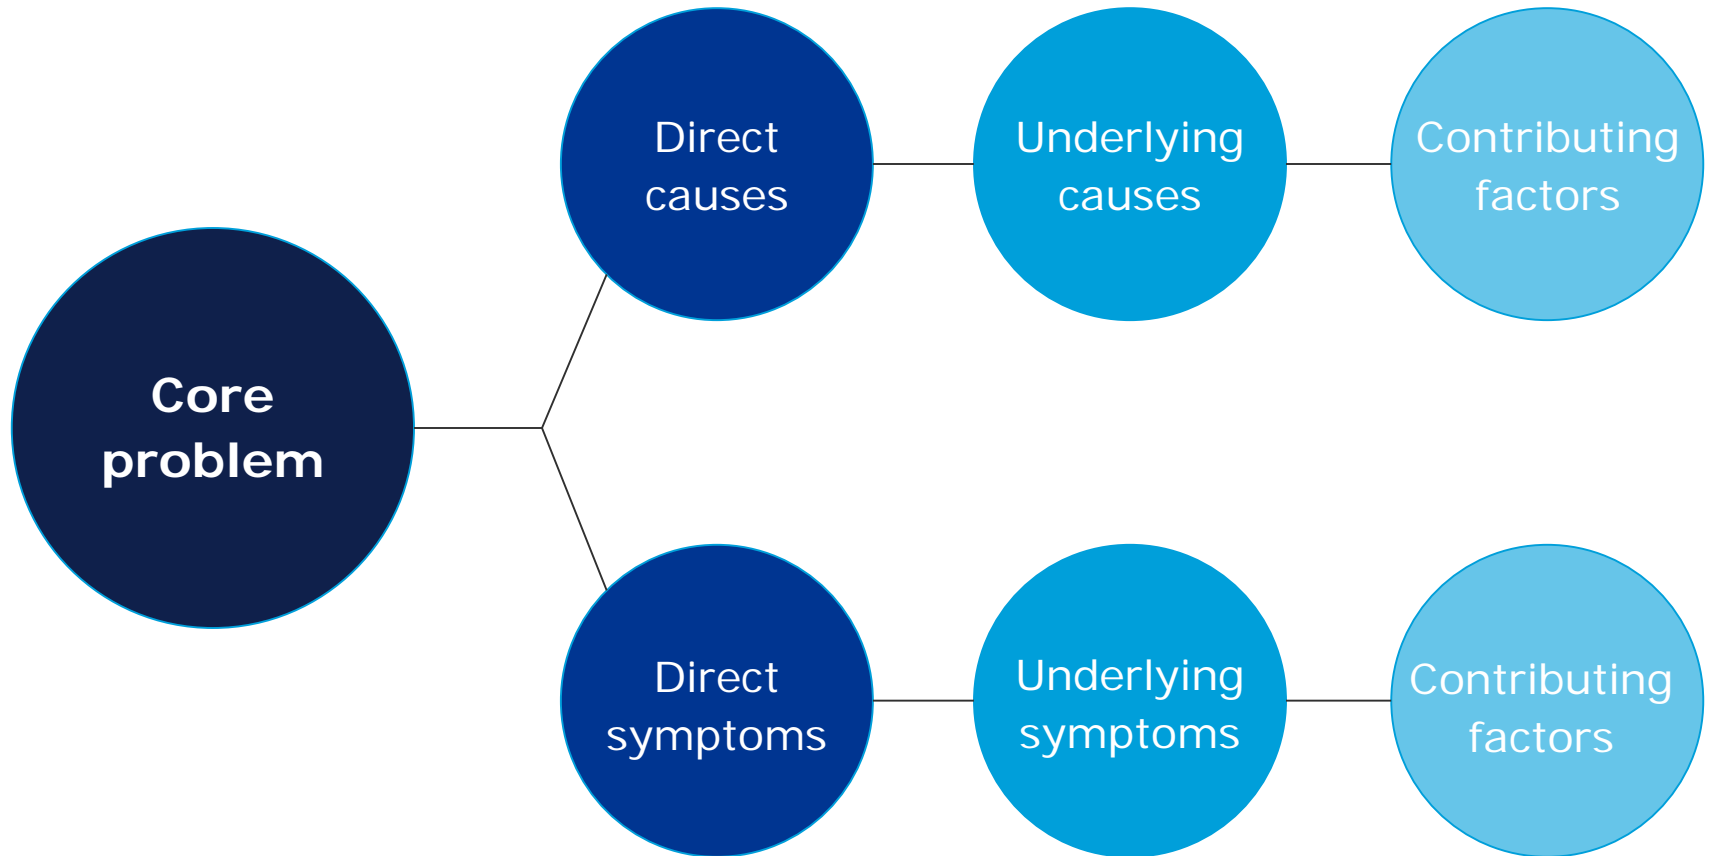

Identifying portfolio-level vulnerabilities

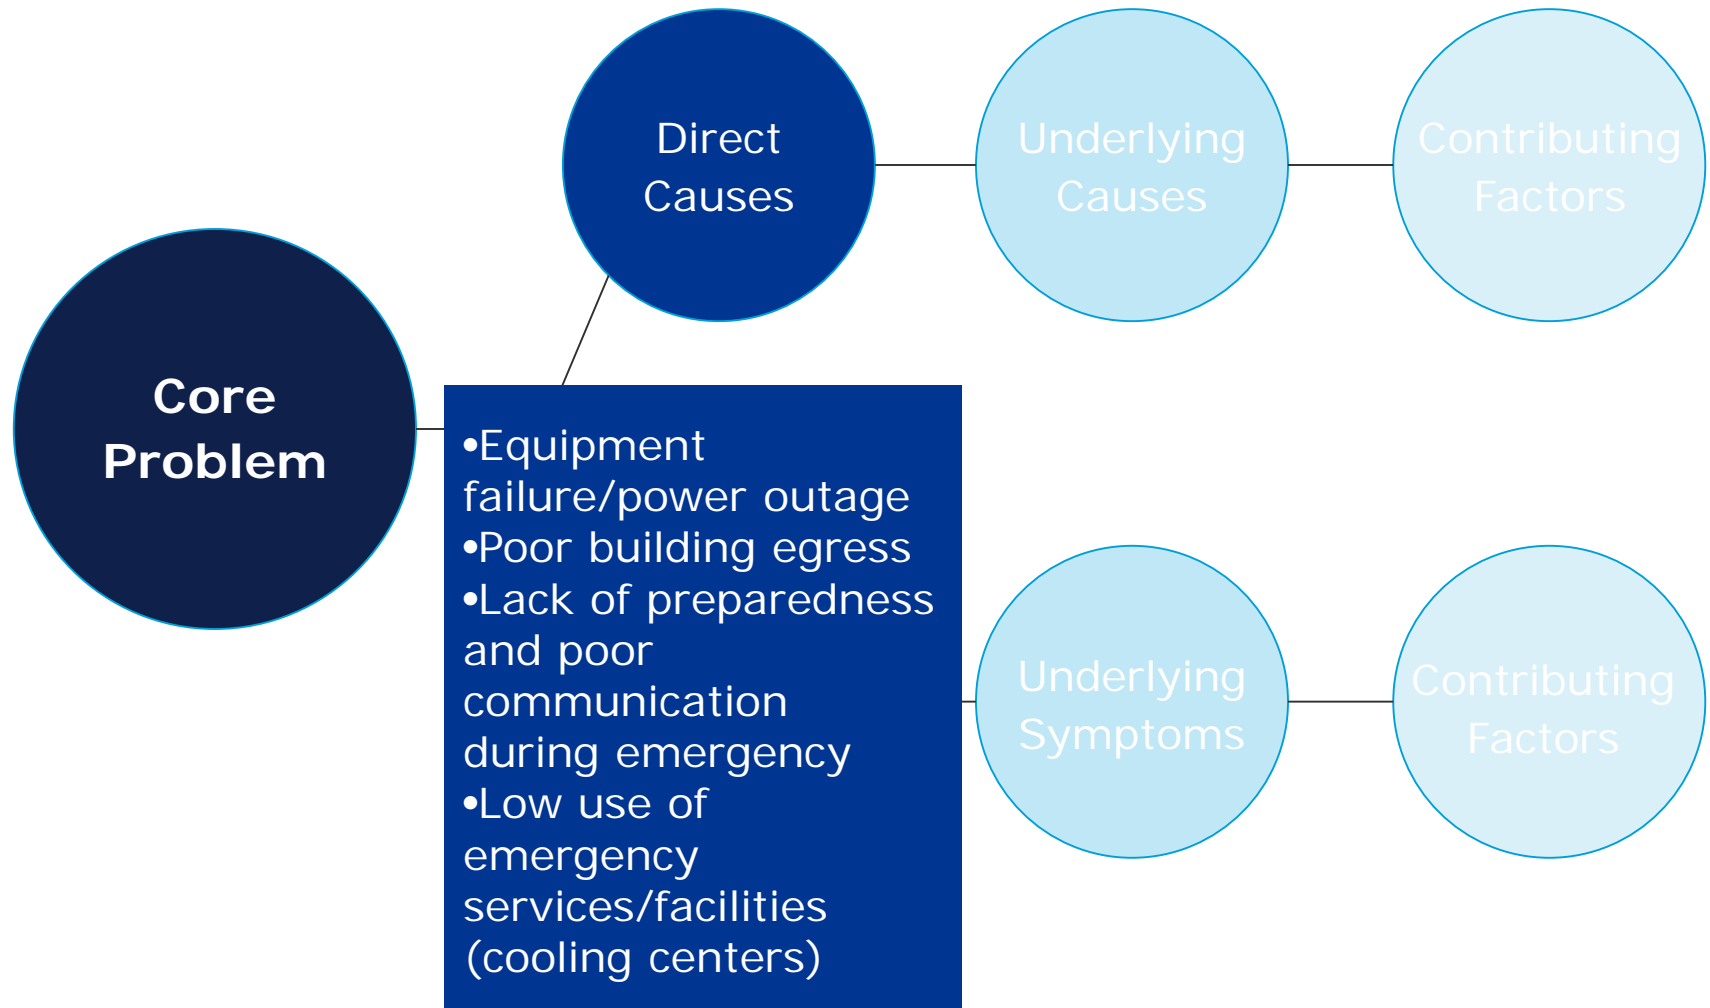

Assessing social systems for resilience

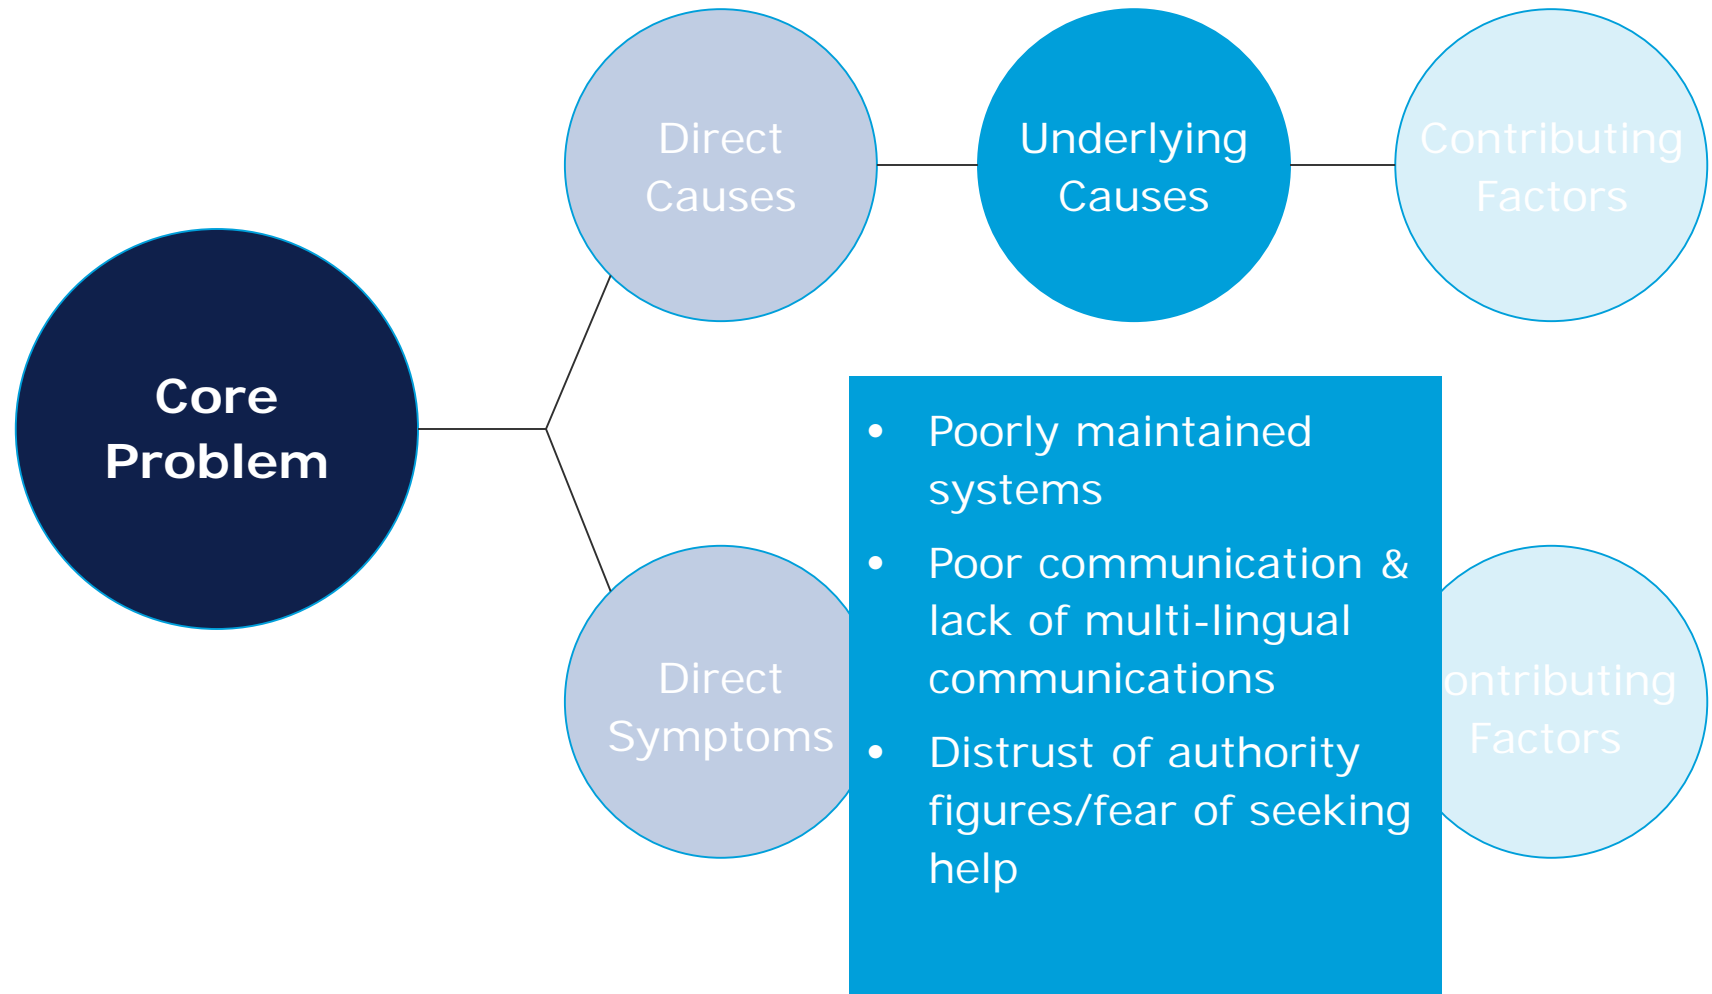

Identifying core challenges for low-middle income communities

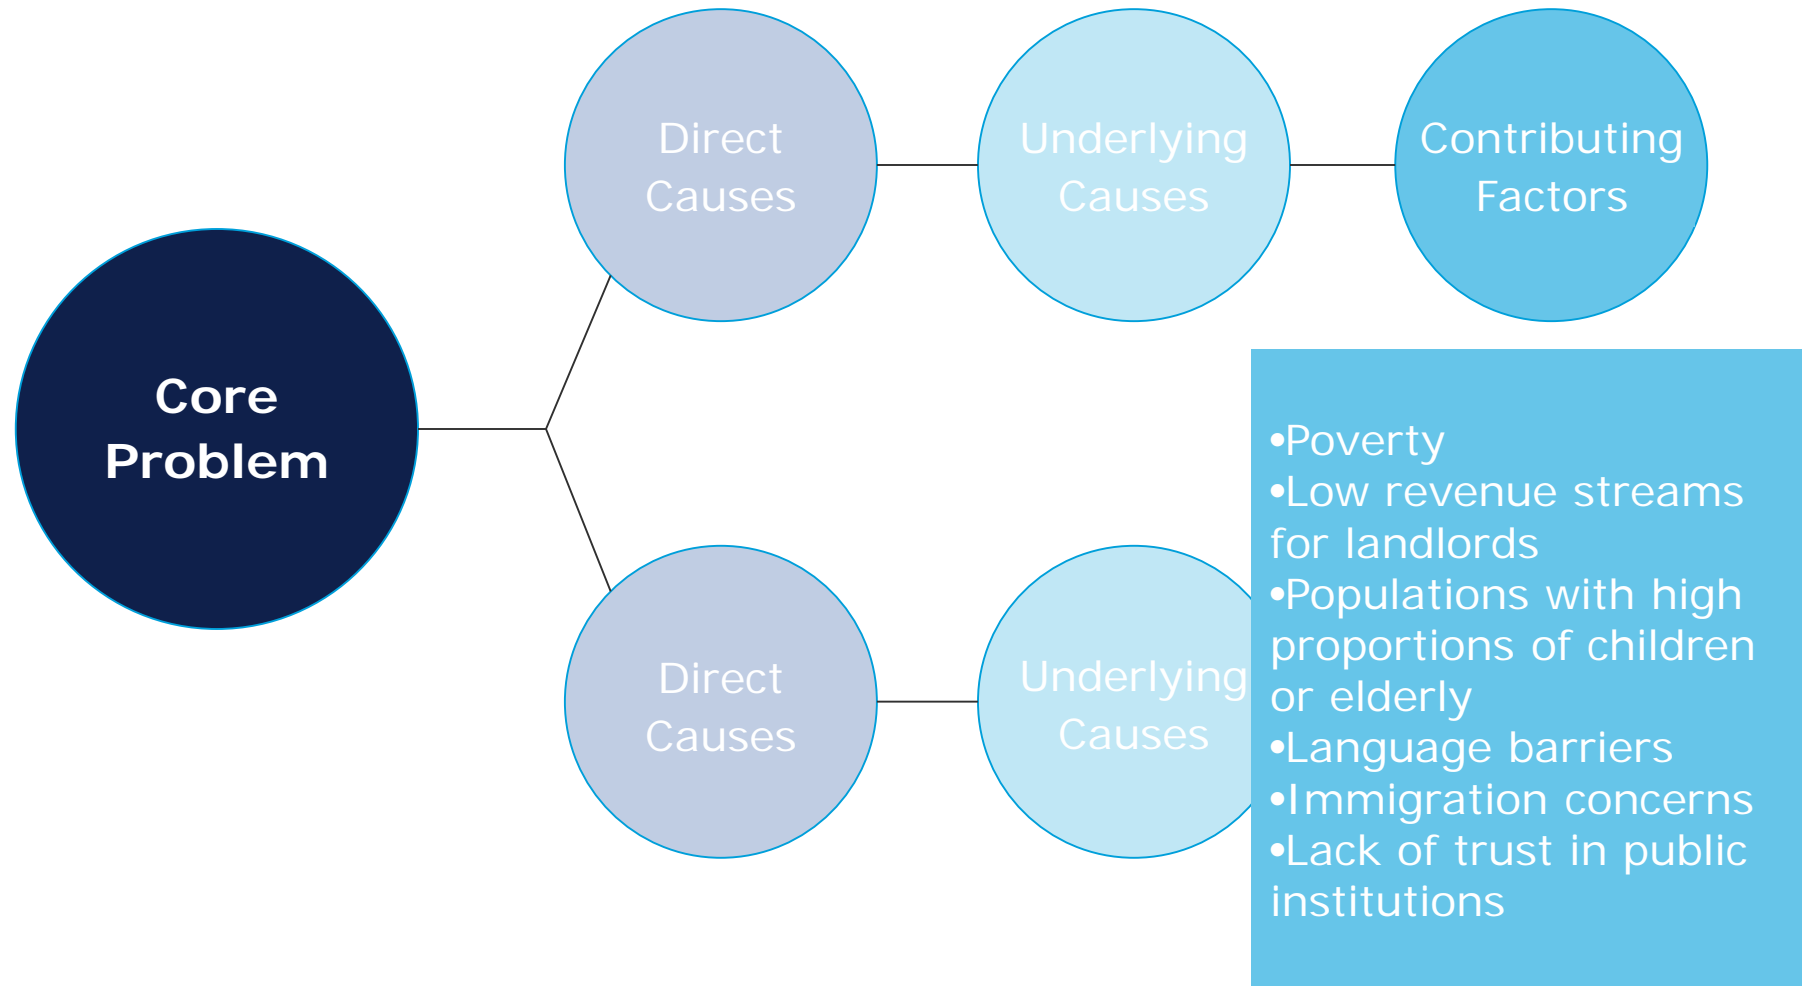

Identifying core challenges for low-middle income communities

Identifying core challenges for low-middle income communities

Identifying core challenges for low-middle income communities

Using workshops to engage residents

Resident awareness is socially motivated

Tenant engagement is minimal, with limited reach to socially isolated groups

Improved communication is needed

Develop a set of measures to assess social resilience

Empowered community champions

Communication with tenants, including ensuring appropriate multilingual communications

Strong social fabric through community events

Resilient buildings reduce risk and add immediate value to the community

RESILIENT CITIES

**Clean, resilient
power**

Strong social fabric

Resilient buildings
